# Student Productivity Tracker

# Project Report

Name: Bhumika Sharma

Registration Number: 25BOE10070

Branch: B.Tech Bioengineering

Course: Introduction to problem solving and programming

Course code: CSE1021

Faculty: Prof.Pavithra R R

# Introduction

In daily student life, managing tasks and assignments can sometimes become confusing and stressful. I personally noticed that it is easy to forget small tasks or delay work when everything is not organized properly. Because of this, I decided to create a simple Python project that can help in keeping track of tasks and improving productivity. The aim of this project is to provide a basic and easy-to-use system for managing daily activities.

# Problem Statement

Students often face difficulty in managing multiple tasks like assignments, studies, and personal work at the same time. Due to lack of proper tracking, tasks are either forgotten or completed late. This creates unnecessary stress and affects productivity.

# Solution

To solve this issue, I developed a Student Productivity Tracker using Python. This program allows users to add tasks, view them, mark them as completed, and check overall progress. The program is simple, runs in the terminal, and is easy to use for anyone with basic knowledge.

# Approach

While building this project, I used basic Python concepts such as lists, dictionaries, loops, and functions. Tasks are stored in a list, where each task contains its name and status (completed or not). I created separate functions for different operations like adding tasks, viewing tasks, marking tasks as complete, and showing progress. A menu-driven approach was used so that the user can easily interact with the program.

# Challenges

One of the main challenges I faced was handling user input properly. Sometimes users may enter invalid data, so I had to make sure the program does not crash. Another challenge was managing the task list and updating the

status correctly. I solved these issues using conditional statements and simple error handling.

# Learning Outcome

Through this project, I understood how programming concepts can be applied to solve real-life problems. I got hands-on experience with Python basics like lists, dictionaries, loops, and functions. I also learned how to structure a program logically and make it user-friendly.

# Conclusion

This project helped me understand the practical use of Python in solving everyday problems. The Student Productivity Tracker is a simple but useful tool that can help students stay organized and improve their productivity. In the future, this project can be improved by adding more features like saving tasks permanently or creating a graphical interface.
